

GHL Tag Cleanup — Review List

1. Safe to delete now — 23 tags

Obsolete programs, old event tags, unused lead-source tags and leftovers. None of these has a single contact attached.

Retired programs whose automations are now unpublished (3)

client - rmm men	client - rmm course only men
client - rmm course only women	

A near-twin of the live Self-Paced tag, never used (1)

client - self paced

Event tags, no longer running (5)

event-clarity-call	event-get-unstuck-men
event-get-unstuck-women	event-relationship-reset-men
event-relationship-reset-women	

Lead-source tags, replaced by the ig/fb tag (4)

lead-facebook	lead-instagram
lead-organic	lead-referral

Miscellaneous leftovers (10)

booked	cancelled calls
comparison	financial
follow-up-needed	freebies
magnetic communication- purchased	offer discussed- rmm selfpaced women
test	warm leads male

2. Do not delete — no contacts, but a live automation triggers on them

These three have zero contacts, so they look deletable. They are not. Each one is the trigger on a published onboarding automation, and deleting the tag leaves that automation listening for something that no longer exists.

Tag	Automation that needs it
client - couples coaching men	Onboarding Email- (men) Couples
client - couples coaching women	Onboarding Email- (women) Couples
client - rmm self paced men	Onboarding Email- RMM- SELF PACED (Men)

3. Hold — reserved for the continuation tracker, 12 tags

These have no contacts yet because the continuation tracker is still in draft, but they are its working parts. The four enrolled - tags are triggers on WF-CT3 Continuation Enrolled and the sweep in WF-CT4, and the eight client - tags are the program tags for the continuation offers Chris confirmed on Sept 11: RFB, Forge, RMM Plus and Continue RMM. Deleting any of them now would have to be undone when the tracker goes live.

enrolled-rfb-6mo	enrolled-rfb-1yr
enrolled-forge-6mo	enrolled-continuermm-6mo
client - continuation rmm men 3mo	client - continuation rmm men 6mo
client - continuation rmm women 3mo	client - continuation rmm women 6mo
client - forge	client - radiant feminine 1 year
client - radiant feminine 1on1	client - rmm plus

4. Check before deleting — 10 tags

Zero contacts, but the names suggest an automation adds or removes them somewhere. Workflow contents cannot be read through the API, so these need a look in the builder first. My expectation is that recovery and calendly-recovery-stop are used by the cancellation and no-show recovery automations, so leave those two alone unless you confirm otherwise.

application-not-qualified	application-qualified
calendly-recovery-stop	communication reset - series completed
no-show	onboarding
precall-application	recovery
soap opera completed	welcome email

5. The confusing near-twins — none of these can be deleted

These are the tags Chris is thinking of when he says similar and easy to confuse. Every one of them has real clients attached, so deleting any of them would wipe the record of what those clients bought from 53 client records in total.

Tag	Real clients	Easily confused with
client - accelerator men	27	client - rmm accelerator men
client - accelerator women	14	client - rmm accelerator women
client - course only men	4	client - rmm course only men
client - course only women	3	client - rmm course only women
client - couples coaching	3	client - couples coaching men / women
client - couples coaching vip	1	client - vip sophie men / women
client - rmm women	1	Heather Kauffman, retired program

The fix for these seven is not deletion. Add each one into the matching onboarding automation as a second accepted tag. Then whichever name a closer picks, the client is onboarded correctly and the history on their record stays intact. This is also what would have prevented Brendan Logan from being missed.

Order to work through it

- 1 Delete the 23 in section 1. Settings, then Tags, search each name and delete. No contact or automation is touched.
- 2 Leave the three in section 2 and the twelve in section 3 exactly as they are.
- 3 Open the automations for the ten in section 4, confirm whether each tag is referenced, then delete only the ones that are not.
- 4 Wire the seven in section 5 into their matching onboarding automations as second accepted tags, and leave the tags in place.

One correction worth passing to Chris. Not every similar-looking tag can be removed. The seven in section 5 carry live client history, so the clean-up will make the list shorter but those near-twins stay. Wiring them in is what stops them causing problems.
